## 1 Project Summary

### Collaborators

J.T. Lennon, *Indiana University, Bloomington, IN*

S.W. Wilhelm, *University of Tennessee - Knoxville, Knoxville TN*

### Project questions

1. Does resource stoichiometry affect the growth rate of *Synechococcus*?
2. How does resource stoichiometry alter ecological dynamics?
3. Does stoichiometry alter phenotypic (co)evolution in cyanobacteria and phage?

### Data collection

Briefly, all data for this project was collected during a long term continuous culture experimental evolution study with *Synechococcus* and SRIM-8 cyanomyophage.

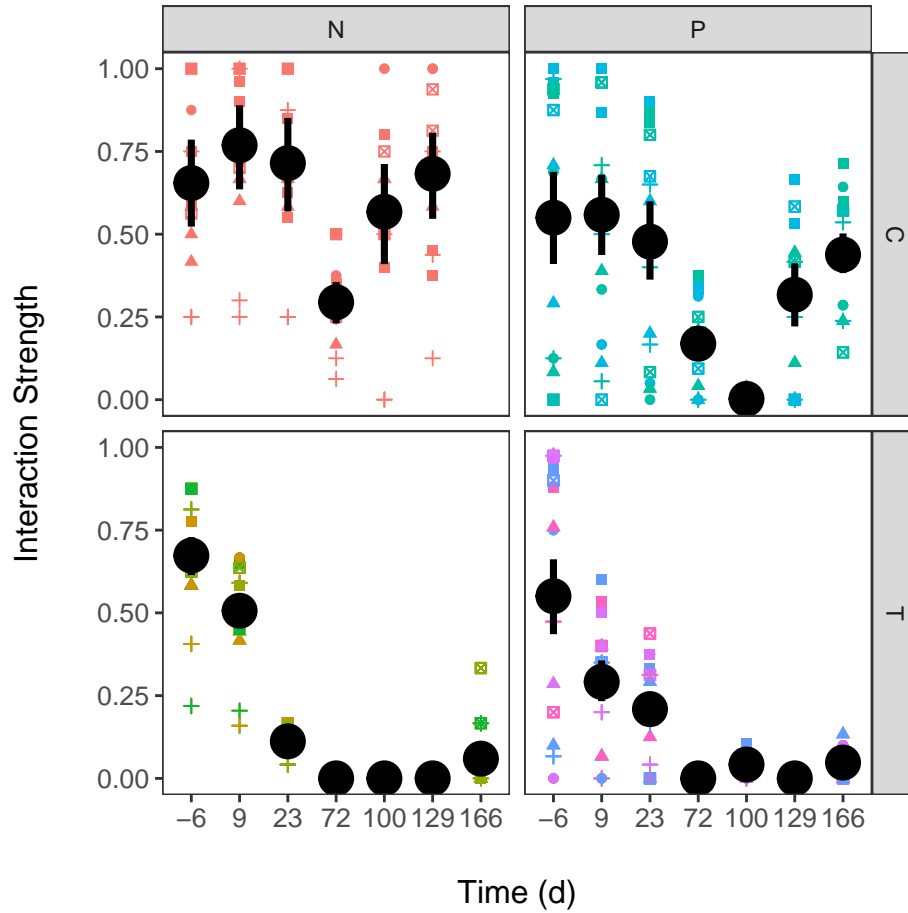

For a complete description of the materials and methods for this repository, see Larsen *et al.* 2016.

Funding for this project was provided in part by the National Science Foundation, Michigan State University BEACON Center for Evolution in Action, and Indiana University.

## 2 Physiological growth: Does nutrient stoichiometry affect the growth rate of *Synechococcus*?

**Overview:** In this experiment, we tested for growth enhancement with the addition of nitrogen (N), phosphorus (P), or the addition of both nutrients to our stoichiometrically modified AN media (Lennon *et al.* 2007; see Larsen *et al.* 2016 Table S1). Population growth curve data was collected on a Biotek Synergy Mx instrument loaded with software version 2.01.12.

### 2.1 Summary of Major Results

1. Addition of N or P to the N-limited or P-limited base medium, respectively, increased *Synechococcus* maximum growth rate (Figure 1) and percent change in growth (Figure 2) in batch culture as compared to control cultures without the addition of N or P.

## 2.2 *Synechococcus* growth rates with response to nutrient addition

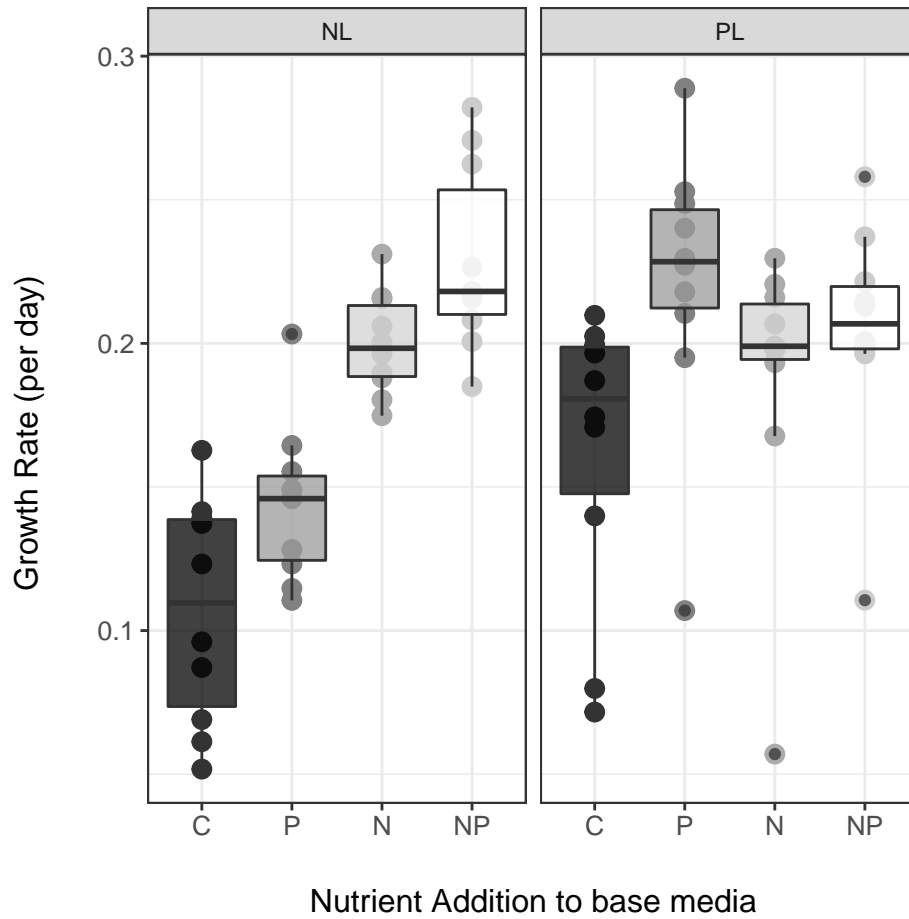

Figure 1: Nitrogen (N), phosphorus (P), or NP addition to the base N-limited and P-limited media used in the chemostat experiment. Culture controls (C) did not contain additional N or P.

### 3 Population Dynamics: Does nutrient stoichiometry affect temporal population dynamics?

**Overview:** In this experiment, whole samples were collected from each chemostat system three times per week for ~5 months. Each sample was processed, stained, and counted using epi-fluorescence on a Zeiss microscope and quantified using Axiovision software. Statistics for these data include repeated measures anova (RMANOVA), stability (1/Coefficient of Variation), and cross-correlation analyses on whitened data using SAS.

#### 3.1 Summary of Major Results

1. Stoichiometry significantly affected *Synechococcus* and phage densities. RMANOVA
2. Altered mean and stability of the populations
3. Modified the temporal coherence, or synchrony, of the *Synechococcus*-phage dynamics, suggesting ecological ramifications of stoichiometry.

## 3.2 Chemostat-level comparisons

### 3.2.1 Population dynamics

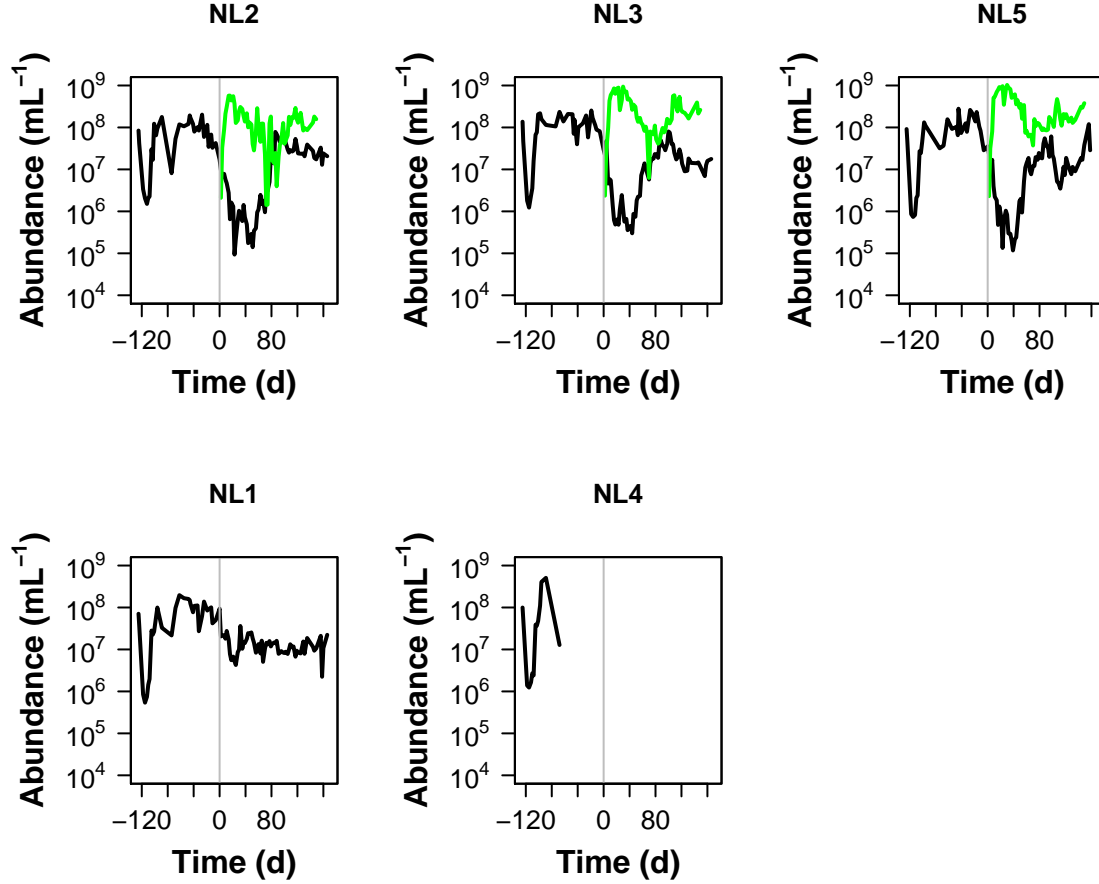

Figure 3: Individual N-Limited chemostat replicates. Chemostats NL2, NL3, and NL5 contained both *Synechococcus* (black) and SRIM8 phage (green) while chemostats NL1 and NL4 contained only *Synechococcus*. Chemostat NL4 was lost due to fungal contamination prior to phage addition.

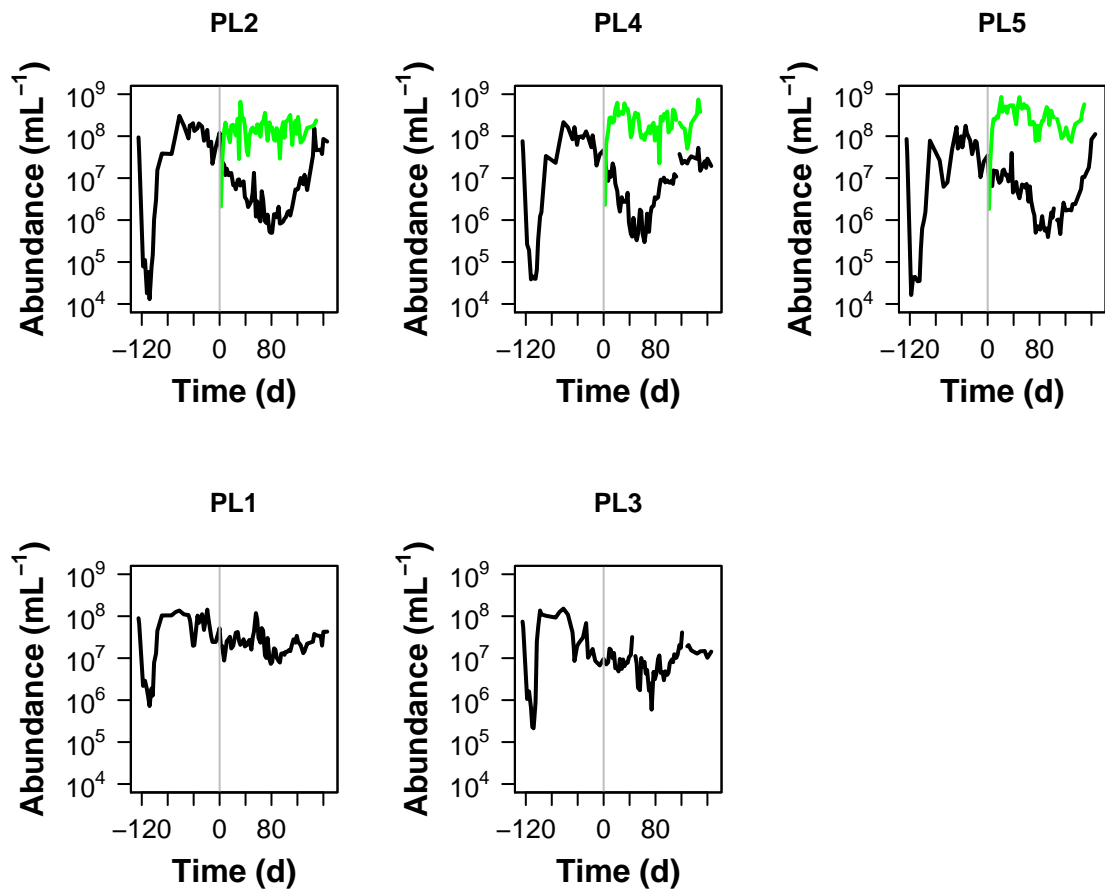

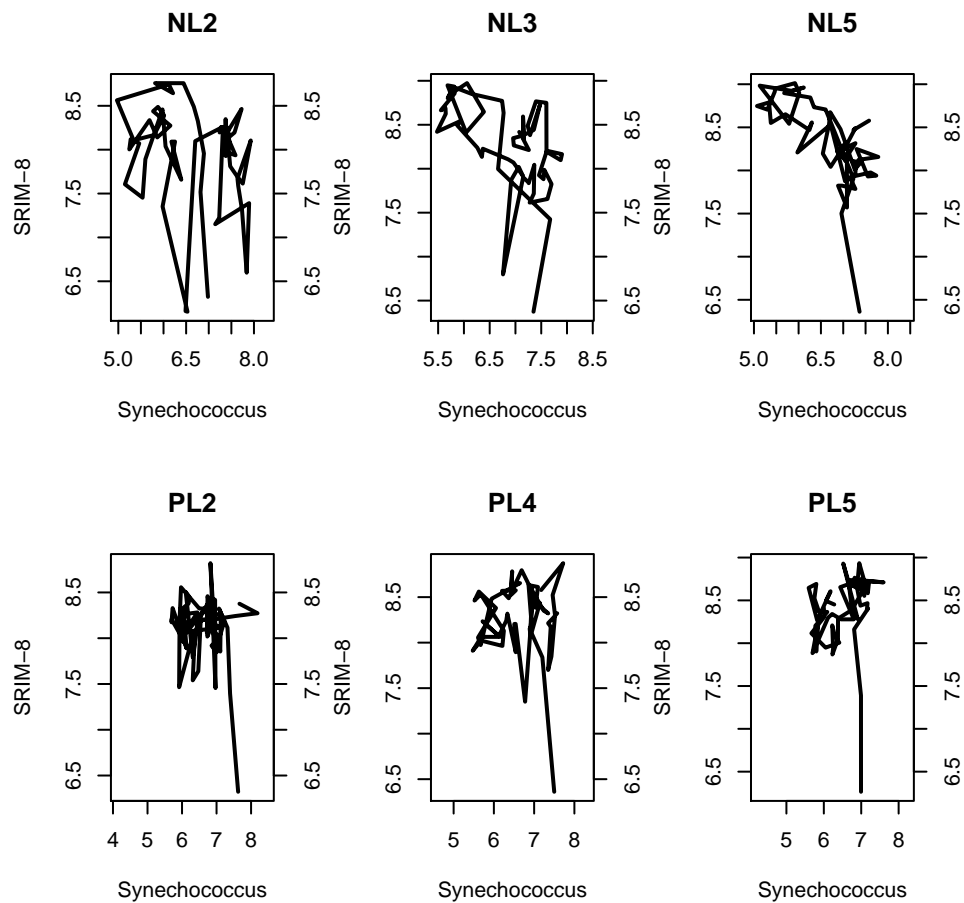

Figure 4: Individual P-Limited chemostat replicates. Chemostats PL2, PL4, and PL5 contained both *Synechococcus* (black) and SRIM8 phage (green) while chemostats PL1 and PL3 contained only *Synechococcus*.

### 3.2.2 Chemostat phase plane diagrams

### 3.3 Treatment-level comparisons

Figure 5: Average population dynamics of *Synechococcus* (white) and SRIM8 phage (black) in N-limited and P-limited nutrient treatments. The dashed line at day 0 indicates the time in which phage were added to the chemostat system.

## 4 Infection Dynamics: Does stoichiometry alter phenotypic (co)evolution in cyanobacteria and phage?

**Overview:** To examine how nutrient stoichiometry impact evolutionary interactions, I collected cross-infectivity data from 96 phage and ~200 *Synechococcus* strains. Each challenge was recorded based on cellular growth where lysis = 1 (i.e. infectious interaction occurred) or no lysis (i.e. no evidence of infection; cell line is resistant). This data was incorporated into network-based metrics.

### 4.1 Summary of Major Results

1. Are temporal infection dynamics affected by stoichiometry?
2. Do community infection networks change as a result of the environment?
3. How are the dynamics affected? Through changes in overall resistance/infectivity?  
Changes in compositional resistance?
